

Air Operated Diaphragm Pump

Max Flow: 115 GPM @105 psi

FEATURES

- **Stall-Free Design** – A patented non-centering, spring assisted shifter is incorporated into every “Y” series pump, ensuring a positive shift every time. All “Y” series pumps eliminate the need of pre-packing or extended lubrication.
- **Oil-less Operation** – Oil-less operation “Y” series pumps incorporate no metal-to-metal wearing surfaces. This design means no oil misting into the environment that would create an unhealthy working condition, and no oil, lubricants or grease to contaminate your products. Our oil-less design results in lower operating and maintenance costs.
- **Quiet Operation** – Air valve design minimizes exhaust noise providing a significantly quieter work environment.
- **Portable/Simple Installation** – Simply connect your air supply line and liquid lines; the pump is now ready to perform. There are no complex controls to install and operate.
- **Submersible** – If external components are compatible, these pumps can be submerged in the liquid by simply running the exhaust line above the liquid level.

The performance curves shown and other published literature reflect an average performance for all materials and all elastomers, including Teflon®. Derating of the performance is not necessary for Teflon® fitted pumps.

To determine the correction flow rate, find the intersection of the VISCOSITY on the above curve and read the FLOW CORRECTION FACTOR. Multiply this factor by the desired flow of the pump and use this new flow rate to select a pump from the performance curves.

Example Δ 10,000 CPS = 2.5 Flow Correction Factor.
If viscous flow desired is 42 GPM, then multiply 42 by 2.5 = 105 (GPM equivalent water flow)

Example Δ 74,000 SSU = 4.0 Flow Correction Factor.
If viscous flow desired is 35 GPM, then multiply 35 by 4.0 = 140 (GPM equivalent water flow)
